Continuous improvement
of productivity

Come see us at **BOOTH 979**

Perfect cadence

TruckFLOW manages the entire distribution process, from choosing the best truck for each dispatch to delivering it on time.

Shift optimization

TruckFLOW assigns orders to trucks in order to take advantage of their load capacity, and manages routes efficiently.

Zero wait

TruckFLOW allows you to choose the order of the trucks that will enter to the plant, in order to avoid delays.

Global satellite positioning

The driver receives an Anti-Explosive iPad upon entering the plant, which will give directions. This will avoid unnecessary maneuvering of trucks.

Less human intervention

Our Led Radar helps the driver position the truck correctly, preventing this function from being performed by an operator.

Integration

TruckFLOW is integrated into the loading computer in order to inform the volume to be loaded and record the loaded volume.

Zero differences

TruckFLOW compares the variation in the weight of the truck with the loaded volume. If there is a difference it generates an audit request.

Just in Time

TruckFLOW keeps the customer informed about the loading process, and the estimated time of arrival. Any delay will be informed.

Better throughput

TruckFLOW gives Operations complete control of the process, and communication with each driver and customer, with tools for a more fluid management.
